April 6, 2026

Little Overview

This document gathers all the current charts produced for the preference analysis. The aim at this stage is to track how the key dimensions of evaluation evolve across demographic categories such as age, gender, education, income level, CSP, and city size.

Overall, this already gives a nice first picture of how perceptions of creativity, humour, originality, trust, purchase intent, and overall preference may differ across groups. This is therefore a small but meaningful progress checkpoint before moving toward deeper interpretation and statistical validation.

Extended Preference Charts

Overall share

This donut chart gives the global distribution for overall preference before looking at how it varies across demographic groups.

overallpreference__by__education

This chart helps assess whether overall preference remains stable or shifts across education levels. It gives a first view of whether educational background relates to broader appreciation.

overallpreference__by__csp

This chart shows whether overall preference varies across socio-professional groups. It gives a broad indication of segmentation by occupation.

overallpreference__by__gender

This figure provides a simple comparison of overall preference by gender. It gives a compact overview of broad differences or similarities.

overallpreference__by__age_group

This chart gives a broad summary of overall preference across age categories. It helps identify whether some generations respond more positively overall.

overallpreference__by__income_level

This chart tracks overall preference by income level. It is useful for seeing whether broader economic status relates to stronger or weaker appreciation.

overallpreference__by__location_city_size

This chart presents overall preference across city size categories. It provides a broad measure of geographic variation in appreciation.

Creativity share

Creativity share

This donut chart summarizes the overall distribution of perceived creativity before zooming into demographic differences.

creativity_by_education

This figure focuses on perceived creativity across education groups. It is useful for checking whether more educated respondents react differently to creative aspects.

creativity__by__csp

This chart compares creativity scores across socio-professional categories. It may reveal whether occupational background shapes creative perception.

creativity__by__location_city_size

This chart examines whether perceived creativity differs across city sizes. It may suggest whether geographic environment influences interpretation.

creativity__by__gender

This figure compares perceived creativity by gender. It is useful for checking whether creative appreciation is fairly balanced or not.

creativity__by__age_group

This figure studies creativity perception through the lens of age. It may reveal whether younger or older groups are more responsive to creative signals.

creativity__by__income_level

This figure looks at creativity perception by income level. It helps explore whether creative appreciation differs across economic groups.

Humour share

Humour share

This donut chart gives the global split for humour perception and serves as a useful overview before the demographic breakdowns.

humour__by__age_group

This figure focuses on humour across age groups. It is especially informative because humour often varies strongly by generation.

humour__by__income_level

This chart explores humour ratings across income levels. It provides an interesting cross-check between economic profile and entertainment value.

humour__by__csp

This figure compares humour across socio-professional categories. It may highlight occupational differences in emotional or informal appeal.

humour__by__gender

This figure compares humour ratings by gender. It gives a direct picture of whether comic appeal is evenly perceived.

humour__by__education

This figure examines humour across education groups. It can help show whether humour is interpreted similarly or differently depending on educational background.

humour__by__location_city_size

This chart compares humour by city size. It is useful for observing whether local context may shape informal or playful reception.

Intent to purchase share

Intent to purchase share

This donut chart provides the overall distribution of purchase intention before the more detailed demographic comparisons.

intent_to_purchase_by_gender

This figure tracks purchase intention across gender. It is especially relevant for understanding commercial resonance across this demographic split.

intent_to_purchase__by__income_level

This figure explores whether income level affects willingness to purchase. It is useful for connecting evaluation to potential commercial value.

intent_to_purchase__by__age_group

This chart examines purchase intent across age groups. It is one of the clearest commercial indicators in the report.

intent_to_purchase__by__location_city_size

This figure shows how purchase intent varies with city size. It is useful for identifying geographic differences in commercial appeal.

intent_to_purchase__by__csp

This chart compares purchase intention across socio-professional categories. It adds another layer to the commercial interpretation of the data.

intent_to_purchase_by_education

This chart shows purchase intention by education level. It is helpful for understanding whether educational background affects the move from appreciation to action.

Originality share

This donut chart summarizes the global distribution of originality before moving to the socio-demographic breakdowns.

originality__by__location_city_size

This figure examines how originality is perceived depending on city size. It is interesting for detecting possible urban versus less urban differences.

originality__by__csp

This chart compares originality perception across socio-professional categories. It may capture differences in sensitivity to novelty.

originality__by__education

This chart looks at originality perception by education level. It helps evaluate whether educational background changes sensitivity to originality.

originality__by__income_level

This figure compares originality scores across income levels. It can indicate whether novelty resonates differently depending on economic profile.

originality__by__gender

This figure focuses on originality perception across gender. It offers a direct comparison on one of the more stylistic dimensions.

originality__by__age_group

This figure tracks originality perception across age groups. It helps identify whether novelty is valued differently across generations.

Reliability & trust share

Reliability & trust share

This donut chart gives the global balance of perceived reliability and trust before examining how it differs across groups.

reliability_trust__by__csp

This chart studies trust and reliability perceptions across CSP groups. It can help identify whether some professional categories are more cautious or receptive.

reliability_trust__by__age_group

This figure compares trust scores across age groups. It is useful for seeing whether older or younger respondents differ in perceived credibility.

reliability_trust__by__income_level

This chart measures trust perception by income level. It helps determine whether confidence in the message is evenly distributed economically.

reliability_trust__by__gender

This figure studies trust and reliability across gender. It helps determine whether perceived credibility is similarly shared across groups.

reliability_trust__by__education

This chart examines reliability and trust across education levels. It is relevant for understanding whether credibility perception varies with academic background.

reliability_trust__by__location_city_size

This chart studies whether city size influences trust. It is particularly helpful for identifying potential place-based differences in confidence.

Grouped Facet Charts

creative_facets__income_level

This grouped chart combines several creativity-related facets by income level. It is useful because it gives a fuller view than one metric alone.

overall_facets_location_city_size

This figure summarizes overall evaluation dimensions across city size categories. It allows a more synthetic comparison of geographic variation.

creative_facets_education

This chart gathers creativity-related indicators across education groups. It helps reveal whether the creative profile stays consistent or diverges by education.

commercial_facets_gender

This grouped view focuses on commercial dimensions by gender. It is especially valuable for comparing purchase-related and market-oriented signals together.

commercial_facets_education

This figure combines commercial facets across education levels. It helps assess whether educational background affects commercial responsiveness.

overall_facets_education

This chart offers a broad grouped view of overall facets by education. It is helpful for identifying coherent patterns rather than isolated metric movements.

commercial_facets_location_city_size

This figure compares commercial-related perceptions across city size. It may indicate whether geography affects the strength of market appeal.

overall_facets_csp

This grouped chart summarizes overall evaluation dimensions across CSP. It provides a compact picture of occupational segmentation.

commercial_facets_csp

This figure focuses on commercial facets by socio-professional category. It is useful for understanding which occupational groups seem more commercially receptive.

creative_facets_age_group

This grouped chart compares creativity-related facets across age groups. It gives a richer view of generational differences in creative perception.

creative_facets_gender

This figure gathers creative facets by gender. It is helpful for seeing whether creative evaluation remains balanced across groups.

commercial_facets_income_level

This chart combines commercial indicators across income levels. It is especially relevant for linking evaluation patterns to economic positioning.

overall_facets_income_level

This figure provides a grouped overview of overall dimensions by income level. It gives a more complete reading than a single preference score.

overall_facets_gender

This grouped chart summarizes the overall evaluation structure by gender. It is useful for checking whether differences are isolated or broad-based.

creative_facets_location_city_size

This figure compares creative facets across city sizes. It helps test whether geographic context affects the broader creative profile.

creative_facets_csp

This grouped chart studies creative dimensions across socio-professional groups. It is helpful for identifying occupational patterns in creative evaluation.

overall_facets_age_group

This figure summarizes overall facets across age groups. It is one of the most useful grouped charts for spotting generational structure.

commercial_facets_age_group

This chart gathers commercial facets by age group. It provides a strong comparative view of how age relates to market-oriented reactions.

Tiny Conclusion

At this point, the visual exploration is already quite rich. The charts suggest that the main evaluation dimensions can indeed be meaningfully broken down by demographic categories, and that some variation appears more strongly for commercial and creative dimensions than for simple overall preference alone.

This makes the current progress encouraging: the descriptive stage is well advanced, and the next natural step would be to identify which of these apparent differences remain meaningful under more formal analysis.

End of progress checkpoint — cute, tidy, and ready for the next step
