

Progress Report on Brand Perception Analysis

Bouygues vs Orange

Complete report including all attached plots with exact filenames

Dimensions: Overall, Reliability / Trust, Originality, Intent to Purchase, Humour, Creativity
Segmentations: Gender, Income level, Education, CSP
Figure policy: All plots included in relevant sections using exact plot names
Date: April 2026

Executive overview

The analysis shows a robust opposition between two brand territories. Orange tends to dominate Reliability / Trust and often Intent to Purchase, while Bouygues tends to dominate Originality, Creativity, and often Humour.

The observations file also shows that not all dimensions behave with the same level of consistency. Some metrics are highly stable across segmentations, while others require more cautious interpretation because of subgroup variation or confidence-interval issues.

Reading guide

This report groups the plots by analytical theme and uses the exact filenames of the attached figures. All figures are included, and each one appears in the most relevant discussion area.

The text follows the observation notes closely. When a plot family is described as perfectly consistent or very consistent, the interpretation stresses structural stability; when it is flagged for investigation, the interpretation stresses heterogeneity or statistical caution.

Highly consistent patterns

Reliability / Trust: structurally in favor of Orange

The observation notes indicate that Reliability / Trust is perfectly consistent by Income Level and Education, consistent by Gender, and only calls for additional checking by CSP because of confidence intervals. This makes it one of the strongest and clearest result families in the full analysis.

Across the attached figures, Orange repeatedly scores above Bouygues, which indicates that trust is not a local effect but a broad market perception. The CSP version should still be discussed carefully, but it does not overturn the general pattern.

Originality: structurally in favor of Bouygues

The observation notes classify Originality as perfectly consistent by Income Level, Education, and CSP, while Gender is also very clear except for a recommended closer look at the non-binary subgroup. This makes Originality the clearest Bouygues-owned attribute in the report.

The gap appears broad, repeated, and not driven by only one demographic or social segment. In practical terms, this is a strong sign that Bouygues occupies a distinctive symbolic position in the competitive landscape.

Creativity: mostly consistent and strongly favorable to Bouygues

The notes describe Creativity as pretty consistent by Income level, very consistent by CSP, and only slightly variable by Gender and Education. This means the figure family is still stable overall, but with modest subgroup nuances worth mentioning.

The visual message remains clear: Bouygues is repeatedly seen as the more creative brand. The small variations across Gender and Education add texture, but they do not change the dominant reading.

Patterns requiring closer interpretation

Overall: informative but not uniformly directional

The notes ask to inspect Income Level, note clearer categories in Gender, explore Education, and recognize that CSP is telling. This means Overall is valuable, but it should not be reduced to a single headline.

Unlike Reliability / Trust or Originality, the Overall metric is an aggregation where different brand strengths can offset each other. This is why some subgroups show Orange ahead, others show near parity, and a few suggest local Bouygues advantages.

overall_{by}education.pngFigure 15: *overall_{by}education.png**overall_{by}csp.png*Figure 16: *overall_{by}csp.png***Intent to Purchase: favorable to Orange but not fully consistent**

The notes explicitly mark this family as heterogeneous: Income Level requires category-specific inspection, Gender is not consistent at all, Education calls for attention to the higher-education trend, and CSP should be discussed category by category.

This pattern is strategically important because it shows that commercial conversion does not perfectly mirror image strength. Orange generally benefits from better purchase intent, but the degree of advantage depends much more on subgroup composition than it does for trust.

Humour: segmented and highly context-dependent

The notes describe Humour as telling by Income Level, interesting by Gender, not consistent at all by Education, and worthy of confidence-interval inspection by CSP. This makes it one of the richest but least uniform domains in the report.

In substantive terms, Humour seems to be a differentiator for Bouygues in many places, but the strength of that advantage depends heavily on subgroup context. It should therefore be interpreted as a segmented communication lever rather than a universally stable brand pillar.

Cross-domain synthesis

The combined picture is analytically coherent. Orange has a broad and stable advantage wherever reassurance, trust, and buying reassurance matter most, while Bouygues owns the more expressive dimensions such as originality and creativity, and often humour as well.

The main progress in this domain is therefore not merely a change in average scores, but the emergence of a clearer brand structure across segmentations. The more consistent domains define the core positioning; the more heterogeneous domains indicate where targeting and creative adaptation matter most.
