

Brand Perception Review

Marta Trales

April 2026

How this deck is organized

Selection rule

Only the plots explicitly marked as worth checking in `plots.md` are included here.

- Reliability / Trust: only CSP.
- Overall: Income level, Gender, Education, CSP.
- Originality: Gender only.
- Intent to purchase: Income level, Gender, Education, CSP.
- Humour: Income level, Gender, Education, CSP.
- Creativity: Gender and Education.

Reading notes from the observations

- Strongly consistent dimensions are not the focus here unless the notes explicitly asked for further checking.
- This deck therefore emphasizes nuance, exceptions, subgroup variation, and confidence-interval concerns.
- Orange generally dominates trust and purchase-oriented metrics, while Bouygues tends to dominate originality, creativity, and often humour.
- The selected plots are the ones most useful for discussion rather than simple confirmation.

Observation from plots.md

Income Level is perfectly consistent, Gender is consistent, Education is perfectly consistent, and CSP is the one noted as worth investigating because of confidence intervals.

- This means the broad conclusion is stable: Orange leads on trust.
- The CSP view is included because it is the only place where subgroup uncertainty deserves extra attention.

Reliability / Trust by CSP

Overall — the most interpretive family

Observation from `plots.md`

Inspect Income Level; Gender shows clearer categories; Education is worth exploring; CSP is also telling much.

- Overall is not as mechanically stable as trust or originality.
- It is useful because it shows how different brand attributes combine in each subgroup.

overall_by_income_level.png

Originality — only the flagged gender view

Observation from `plots.md`

Income Level is perfectly consistent, Education is perfectly consistent, CSP is perfectly consistent, and Gender is the one flagged with “check non binary”.

- Bouygues is clearly stronger on originality overall.
- The gender view is included because the non-binary category deserves closer reading.

Intent to purchase — interesting precisely because it is uneven

Observation from plots.md

Income Level: check specific categories; Gender: not consistent at all; Education: check trend with higher education levels; CSP: discuss a bit some categories.

- This is one of the best sections for discussion because the pattern changes across segmentations.
- Orange is often ahead, but not with the same stability seen in trust.

intent_to_purchase_by_income_level.png

intent_to_purchase_by_education.png

Observation from `plots.md`

Income Level is telling; Gender shows interesting categories; Education is not consistent at all; CSP requires inspection of confidence intervals.

- Humour is not a uniform brand asset across the full population.
- It becomes useful when read as a subgroup-sensitive communication dimension.

humour_by_income_level.png

Creativity — mostly stable, but two views worth checking

Observation from `plots.md`

Income level is pretty consistent, CSP very consistent, while Gender shows slight differences worth investigating and Education shows very slight differences.

- Bouygues is broadly stronger on creativity.
- The two included plots are the ones where the notes suggest a closer qualitative reading.

What this selected deck shows

The most interesting plots are not the ones that simply confirm the main story, but the ones that reveal nuance, instability, or subgroup-specific interpretation.

- Trust remains structurally Orange-led, but CSP deserves caution.
- Overall is mixed and therefore strategically informative.
- Originality remains Bouygues-led, with gender nuance worth noting.
- Intent to purchase and Humour are the most segmented families.
- Creativity is stable overall, with only light variation in gender and education.
